

Dental Implants

Teeth-in-an-Hour™

Elaine Ludian

Teeth-in-an-Hour™ is a new dental implant surgery system that streamlines the treatment process and provides the patient with permanent teeth in record time. The system incorporates the magic of CT Scans and 3-D imaging software to accurately assess bone structure, map out the areas of best integrity, and create a permanent prosthesis prior to surgery. This revolutionary system offers a more accurate and safer positioning of dental implants and provides the patient with permanent teeth in about an hour.

What is a dental implant?

A dental implant is a small titanium screw that serves as the replacement for the root portion of a missing natural tooth. Dental implants can be placed in either the upper or lower jaws. Due to the biocompatible properties of titanium, a dental implant fuses with the bone and becomes a good anchor for the replacement tooth. Dental implants can be used in solutions for replacing single or multiple missing teeth.

Why dental implants?

Without the root structure of a natural tooth present, the jawbone can shrink. This shrinkage will make your face look older than it is. There are no loose parts to worry about losing. The dental implant is stable and comfortable.

Will dental implants work for me?

Anyone who is missing one or more teeth due to injury, disease or tooth decay may be a candidate for dental implants. The determining factor is the amount of available bone.

What are the advantages of dental implants over dentures or a dental bridge?

Improved appearance: When you lose the entire tooth - crown and root - shrinkage of the jawbone may cause your face to look older. Dental implants can stop this process. A traditional denture or dental bridge doesn't.

Preserve natural teeth: With traditional dental bridges, teeth adjacent to missing teeth are normally ground down to be used as anchors for a dental bridge. Dental

implants often eliminate the need to modify healthy teeth.

Permanent solution: There are no loose parts to worry about losing. The dental implant is stable and comfortable.

How will dental implants affect my life?

Dental implant-supported replacement teeth look, feel and function like natural teeth. This means that you can eat and drink whatever you choose. But most importantly, dental implants often improve quality of life in a very concrete way. People who have felt embarrassed and worried because of their tooth problems are often overwhelmed by what new permanent teeth can do for their self-esteem.

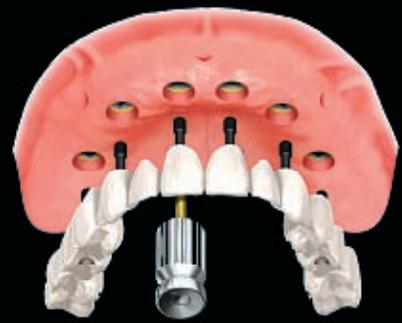

Will my new teeth look natural?

When dental implants are used in combination with modern restorative dentistry, their appearance, comfort and function are very likely to exceed your expectations. Often they are hard to tell apart from your natural teeth.

How much time is required for a dental implant placement?

Today, state-of-the-art guided surgical techniques are convenient alternatives to place dental implants and allow you to have the dental implant placed in a single session using *keyhole surgery*. This new method has significantly simplified the procedure, for both patients and dentists. The major advantage of the guided surgical technique is the minimal

Teeth-in-an-Hour™ is a new dental implant surgery system that streamlines the treatment process and provides the patient with permanent teeth in record time.

amount of manipulation of the soft tissue due to *keyhole surgery*. This significantly reduces the healing time and the discomfort normally associated with traditional dental implant surgical techniques.

Is the treatment painful?

With any surgery, there can be some discomfort. Placing one implant normally causes less discomfort than placing several. Anesthesia and patient sedation are commonly administered to help reduce any discomfort during the dental implant process. Most patients report that they were much more comfortable following the procedure than they had anticipated. Your doctor will prescribe medications to ease any discomfort that may occur.

How will I care for my dental implants?

Your new teeth must be cared for and checked regularly, just like your natural teeth; brush and floss as recommended by your dentist or dental hygienist. You should see your dentist in six months, or more frequently if so advised.
